HOW TEACHERS CAN HELP CHILDREN WHO STUTTER

Teachers are one of the most important parts of a child’s environment. For children who stutter, a teacher’s understanding and support can have a major impact on the child’s experience of stuttering.

Different children have different needs of their therapists and teachers. The most important thing you can do is listen to the child to learn about his needs. Situations you may see include: a child who has been bullied, a child who is reluctant to express feelings about stuttering, a child who is embarrassed about speaking, or a child who does not participate in classroom activities (reading aloud or giving reports) because of a fear of stuttering. All of these situations, and many others, are faced by children who stutter.

The good news is that teachers can help. First, remember that you define the communication environment in your classroom. Through your own model, you can establish the patterns that other children will follow when reacting to children who stutter. Second, there are many ways you can provide a supportive communication environment for children who stutter.

For example:

- Minimize interruptions of children’s speech and model an easy, relaxed speaking style.
- Exhibit a positive, accepting attitude about different communication styles and abilities.
- Act as a liaison between therapy and the classroom; you can aid in therapy progress.
- Be a source of understanding and support. You are in a unique position to help the child who stutters accept himself.
- Be aware of the messages you (and your students) send. Help everyone understand the importance of acceptance.
- Work together with parents, speech-language pathologists, and others to support the child, both in and out of the classroom.

By implementing these and other strategies, you can help the child learn that it is okay to stutter and that you support him.
WHAT IS STUTTERING?

Stuttering can be described in many ways, and many definitions have been offered by speech-language pathologists (SLPs) and scientists. Put simply, stuttering is a communication disorder involving disruptions, or disfluencies, in the flow of speech. Stuttering involves more than just the production of disfluencies; however, Stuttering can also have a significant impact on a child's ability to communicate in key settings, including the classroom. This can lead to low self-esteem and reduced self-confidence, as well as difficulty participating in activities that involve communication.

WHAT DOES THE CHILD FEEL?

Every child who stutters is different. Many children experience negative consequences because of stuttering, though some do not. Children just want to be like their peers, and stuttering often makes it hard for them to do that. Children's communication difficulties can contribute to feelings of insecurity, frustration, or shame. Children also react to the expectations of parents, teachers, and others who want them to speak fluently. Avoidance of speaking situations, words, or sounds can result from the child's desire to meet these expectations. Many children will go to great lengths to hide their stuttering and prevent their private struggle from becoming a public one.

WHAT IS KNOWN ABOUT STUTTERING?

Approximately 1% of the population stutters. Current estimates put the total number of people who stutter in the U.S. at about 3 million. The causes of stuttering are complex, and theories indicate that stuttering is due to a variety of aspects of the child's development. We know that stuttering is not caused by psychological or physical trauma, and it is not an emotional disorder. Children who stutter do not have higher or lower intelligence levels because they stutter.

Stuttering is a highly variable disorder. Children stutter more in some situations, and less in others situations. It is often hard to figure out what causes the change from situation to situation. This variability adds to the mystery surrounding stuttering and makes it harder for the child to know how to deal with his speaking difficulties. Many children exhibit early signs of stuttering in the pre-school years, though most outgrow it. Unfortunately, we cannot predict which children will develop normal fluency and which will continue to stutter. Early assessment, diagnosis, and treatment are critical for ensuring the child's long-term communication success.

WHAT ABOUT SPEECH THERAPY?

Speech therapy can help children who stutter communicate more easily and more effectively. Unfortunately, there are no instant cures, and “quick fixes” usually do not last for very long. Successful therapy involves a process of change over time, through which children learn to manage speech and make positive changes for the long term. Therapy is not easy for the child or clinician, but it can make a difference.

WHAT ARE THE GOALS OF THERAPY?

For the child who already has an established pattern of stuttering, the goal of therapy is not simply to make the child fluent. Of course, improved fluency is important; however, it is only part of the process. Therapy also helps to prevent negative emotions or avoidance behaviors from becoming part of the child's stuttering. This means that even when a child cannot speak fluently, he can still speak freely and say what he wants to say. The overall goal of therapy is effective communication in the classroom and elsewhere. Successful therapy fulfills two important roles in the child's life: it increases speech management skills and it creates positive beliefs and feelings about speech, stuttering, and self.

HOW TEACHERS CAN HANDLE TEASING

Bullying is a part of everyday life for many kids, and it is often not a problem that is easily fixed. Still, we can help children who stutter learn strategies for dealing with bullying on their own. The goal of these strategies is to help the child respond in a way that will minimize future bullying experiences, while supporting the child's self-esteem and confidence.

For example:
- Establish a classroom atmosphere that fosters a tolerance for differences among all children (not just children who stutter).
- Handle teasing or bullying about stuttering in the same matter-of-fact, positive way that you handle any bullying episodes.
- Discuss teasing episodes discreetly, and don’t forget to ask the child who stutters what they need from you.
- Ask your school SLP to get the NSA’s booklet on bullying and children who stutter.

ADDITIONAL SUGGESTIONS

1. Finishing sentences and filling in words is not generally helpful. Even though you may be trying to help, this can put even more pressure on the child/student who stutters.
2. Be a good listener. Maintain normal eye contact and do not seem impatient, embarrassed, or alarmed. Wait patiently until the child is finished speaking.
3. Don’t give advice such as ‘slow down’ ‘take a breath’ or ‘relax’. These are simplistic responses to a complex problem.
4. Let the child know, by your manner and actions, that you are listening to what are saying, not how they are saying it.
